1 INTRODUCTION

Pursuant to the United States Environmental Protection Agency (EPA) Administrative Order, Docket Number RCRA-03-2008-0355TH (AO), Chevron Environmental Management Company (Chevron) is conducting remedial activities at, and adjacent to, the former Chevron Service Station (Facility No. 122208) located at 5801 Riggs Road, Chillum, Maryland (the site). In accordance with Section VI, Paragraph E, subsection 3(c) of the AO, ARCADIS on behalf of Chevron has prepared this Semi-Annual Progress Report (Report) to describe actions taken by Chevron pursuant to the AO. The reporting period for this report is January through June 2016.

The remainder of this Report provides information on the following:

- Section 2.0 - System Overview
- Section 3.0 - Discontinue Operation and Maintenance of Vapor Mitigation Systems
- Section 4.0 - Operation, Maintenance, and Monitoring
- Section 5.0 - Submittal of Deliverables
- Section 6.0 - Summary of Findings
- Section 7.0 - Permit Compliance
- Section 8.0 - Summary of Deviations from Approved Plans, Problems Encountered, and Corrective Actions Taken
- Section 9.0 - Summary of Meetings with Public and Government
- Section 10.0 - Changes in Key Personnel During the Reporting Period
- Section 11.0 - Projected Work for the Next Reporting Period

2 SYSTEM OVERVIEW

The piping and instrumentation diagrams for the systems (Appendix A) provide specific system information, such as equipment models and sizes, piping sizes, controls, and other technical information.

2.1 Area A Dual Phase Extraction System

Area A encompasses the former Chevron service station, the existing remediation system compound adjacent to the service station, and the shopping center parking lot near the intersection of Eastern Avenue and Riggs Road in Chillum, Maryland. Duplex residential homes are present southwest of Area A, and land use is generally commercial in all other directions. The Dual Phase Extraction (DPE) System consists of total fluids extraction and treatment as well as soil vapor extraction (SVE) and treatment.

2.1.1 Total Fluids Recovery and Treatment

Pneumatic total fluids (i.e., groundwater and liquid phase hydrocarbons [LPH], if present) pumps are installed in 11 DPE wells (RW-1, RW-2, RW-3, RW-4, RW-5, MW-7, MW-17, MW-22R, GP-27R, GP-39R and PTW-B). Total fluids are pumped from the wells through buried piping to the total fluids manifold located in the remediation system trailer. The total fluids manifold leads to a coalescing-type oil/water separator. Level sensors in the oil/water separator control a centrifugal pump that intermittently transfers the water to an air stripper. LPH accumulate in the separator and are manually skimmed off on a periodic basis (if present). Effluent air from the air stripper is treated using two vapor phase granular activated carbon (GAC) vessels in series and then discharged to the atmosphere in accordance with Maryland Department of the Environment (MDE) Air Quality General Permit to Construct for Groundwater Air Stripping, Identification No. 033-9-1160. Treated water from the air stripper is pumped through three parallel bag filters and then through two liquid phase GAC vessels in series. The treated effluent flows through a buried pipe to a storm drain inlet located in Riggs Road near the intersection at Eastern Avenue, N.E. in accordance with MDE General Discharge Permit No. 2008-OGR-8514 (National Pollutant Discharge Elimination System [NPDES] Permit No. MDG918514).

2.1.2 Soil Vapor Recovery and Treatment

SVE is conducted at 12 wells (i.e., the 11 DPE wells plus MP-7). An individual piping leg runs from each well to a common 3-inch manifold in the remediation system trailer. The manifold leads to a moisture knockout tank and then to the blower. The blower is a rotary lobe, positive displacement blower controlled by a variable frequency drive. Soil vapor is conveyed from the blower to a catalytic oxidizer for treatment. Treated air is discharged to the atmosphere in accordance with MDE Air Quality General Permit to Construct for Soil Vapor Extraction Equipment, Identification No. 033-9-1164. Water collected in the knockout tank is pumped to the oil/water separator for treatment.

2.2 Area B In-Situ Groundwater Remediation Wells

Area B is located in the alley between Oglethorpe Street and Eastern Avenue, NE, in Washington, D.C. (Oglethorpe Alley). The area surrounding Area B is residential, with brick duplexes and triplexes lining Oglethorpe Street and Eastern Avenue.

The Area B system consists of two in-situ groundwater remediation (ISGR) wells (ISGR-1 and ISGR-2) that are installed in the Oglethorpe Alley forming a transect along the alley. ISGR-1 and ISGR-2 were started on August 28, 2013. The objective of the ISGR wells is to remove dissolved hydrocarbon mass from groundwater in Area B by adsorption to liquid phase GAC.

For each ISGR well, water enters the shallow aquifer inlet screen, which is placed at an appropriate depth to intersect dissolved hydrocarbons, and is pumped through liquid phase GAC to remove hydrocarbons to non-detect levels. The treated water is released by gravity to the deep aquifer through an outlet screen in the same well. The targeted pumping rate of each well is 1 to 2 gallons per minute (gpm), depending on aquifer response.

The submersible pump is operated by a control panel mounted on a base with the electrical power (utility) meter. The pump is driven by a controller, which controls the speed of the pump, depending on observed system performance and operator input. The pumping rate can be adjusted over a range of approximately 1 to 10 gpm.

2.3 Area C Oxygen Reactive Zone

Area C is located in the alley between Oglethorpe and Nicholson Streets, NE, in Washington, D.C. (Nicholson Alley). The area surrounding Area C is residential, with brick duplexes and triplexes lining Nicholson and Oglethorpe Streets.

The objective of the oxygen reactive zone (ORZ) is to increase the concentration of dissolved oxygen (DO) in the subsurface of the Nicholson Alley to stimulate the growth of native microbes that use oxygen to degrade dissolved petroleum hydrocarbons. The intent of the system is the reduction of dissolved hydrocarbons downgradient of Area C through the biotransformation of dissolved hydrocarbons by aerobic microbes. The Area C ORZ system was started on August 29, 2013.

Five oxygen injection wells (IW-1 through IW-5) are installed in the Nicholson Alley. The locations of the wells and vertical positions of the well screens correspond to the areas of highest petroleum hydrocarbon concentrations as determined from previous site investigation activities. Oxygen hoses are routed in and out of each well vault through polyvinyl chloride inlet and outlet conduits. An oxygen emitter is installed in each injection well within the screened interval of the wells.

Oxygen is supplied to the oxygen emitters by an oxygen cylinder housed in a non-permit required confined space pre-cast concrete vault installed below grade in the Nicholson Alley. The vault is located in line with, and centered between, injection wells IW-1 and IW-2 and is equipped with a floor sump with level sensor, a passive ventilation system, and a continuous monitoring oxygen detector to monitor for oxygen leakage.

3 DISCONTINUED OPERATION AND MONITORING OF VAPOR MITIGATION SYSTEMS

Based on Section 5.7 of the approved Interim Measures Work Plan for Vapor Sampling and Mitigation, if the data trend over three consecutive years suggests that continuous operation of any vapor mitigation system (VMS) installed is no longer necessary to protect human health, Chevron may petition EPA for system termination review.

Chevron submitted a letter dated November 7, 2013 to EPA to formally request a termination review and EPA approval that operation and maintenance of the three VMS units located at 746 Oglethorpe Street, 5818 Eastern Avenue, and 5824 Eastern Avenue Washington, D.C. be discontinued. In a letter dated January 9, 2014, the EPA approved Chevron's request to discontinue operation and maintenance of the three VMS units.

In response to the approval, the residence owners at 746 Oglethorpe Street and 5818 Eastern Avenue were contacted by Chevron in February 2014 and informed that per the 2010 Final Remedy and as detailed in the 2010 Homeowner Report (that the resident owners previously received from the District Department of Energy and the Environment (DOEE), they were deemed eligible to receive a VMS from the DOEE and they should not remove the VMS currently installed in their home. Following confirmation of receipt of this correspondence, the DOEE was to contact the resident owners to coordinate future operation and maintenance events.

Additionally, in response to the approval, the residence owner at 5824 Eastern Avenue, who was deemed not eligible to receive a VMS from the DOEE (per the 2010 Final Remedy), was contacted (by Chevron) in February 2014 to determine whether the system will be removed from the building or left in place. No request for the removal of the system at 5824 Eastern Avenue has been received to date, therefore; the system will be left in place, and the residence owner is responsible for all costs (including electricity) associated with further maintenance and operation of the system.

Notification letters, inclusive of the EPA approval date and the information discussed above, were submitted to each resident via certified mail.

4 OPERATION, MAINTENANCE, AND MONITORING

This section provides a summary of operation, maintenance, and monitoring (OMM) activities conducted at the site during the reporting period.

4.1 System Operation

This section provides a summary of operations for Area A, B, and C systems and includes a discussion on system uptime and downtime and other related operational points of discussion. A description of the routine OMM requirements for Areas A, B, and C, are also provided in the following sections.

4.1.1 Area A Dual Phase Extraction System

Routine OMM site visits to record measurements and collect samples are performed every other week (twice per month). The reduction from weekly routine OMM visits to every other week is based on permit requirements to collect two effluent samples per month for an Area A effluent flow of less than 500,000 gallons per month to the municipal storm drain. Additional visits are made to the site each month for specific maintenance needs and to respond to system alarms as needed.

The operating hours for both the total fluids and SVE portions of the DPE system were logged regularly during the reporting period by collecting measurements from the solenoid and hour meter, respectively. For the period of January 1, 2016 through June 30, 2016, the total fluids extraction portion of the system was operating 88.8 percent of the time (3,879 hours on and 489 hours off). During the same time period, the SVE portion of the system was operating 88.5 percent of the time (3,864 hours on and 504 hours off).

Table B-1 in Appendix B contains total fluids extraction system data including date and time, on/off status, totalizer reading, cumulative gallons of hydrocarbons recovered, operating extraction points, maintenance information, reasons for system downtime, and types of maintenance performed during this reporting period and the previous period (July 1 through December 31, 2015). A detailed explanation of the tables is provided on the first page of Appendix B.

Table C-1 in Appendix C contains soil vapor extraction system data including date and time, on/off status, hour meter readings, manifold air flow readings, manifold vacuum readings, influent and effluent screening concentrations measured using a flame ionization detector (FID), cumulative gallons of hydrocarbons recovered, operating extraction points, maintenance information, reasons for system downtime, and types of maintenance performed during this reporting period and the previous period. A detailed explanation of the tables is provided on the first page of Appendix C.

Optimization of the DPE system has typically been performed on a semi-annual basis. Data collected during optimization events is utilized to maximize mass removal by targeting vapor extraction on wells exhibiting higher influent concentrations. DPE optimization was not performed during the reporting period, but was performed on July 12, 2016. Optimization events for the next reporting period (July 1 through December 31, 2016) and onward will be performed monthly (at a minimum) to provide the project team with data to gain a better understanding of the current status of the system and the limitations related to the existing system configuration and equipment.

4.1.2 Area B In-Situ Groundwater Remediation Wells

Routine OMM visits to Area B are conducted monthly or as needed to check system operation status, to collect carbon performance samples, and record system data.

SEMI-ANNUAL PROGRESS REPORT JANUARY THROUGH JUNE 2016

The operating hours for both ISGR wells were logged regularly during the reporting period by collecting measurements from the hour meters during each visit. For the period of January 1 through June 30, 2016, ISGR-1 was operating 94.5 percent of the time (4,128 hours on and 240 hours off). During the same time period, ISGR-2 was operating 99.1 percent of the time (4,330 hours on and 38 hours off).

Table D-1 in Appendix D contains ISGR monitoring data for each well including date and time, on/off status, hour meter reading, total gallons pumped, system flow, influent pressure, and pump operating hours.

4.1.3 Area C Oxygen Reactive Zone

Routine OMM visits to Area C are conducted monthly or as needed to check system operation status, to collect quarterly DO measurements, and record system data. DO measurements are recorded on a quarterly basis from the injection wells and specified system performance monitoring wells.

Table E-1 in Appendix E contains ORZ monitoring data including date and time, on/off status, oxygen cylinder pressure, cylinder regulator pressure, well regulator pressure and vault oxygen sensor reading.

4.2 System Maintenance

This section provides a summary of routine and non-routine maintenance activities performed for the Area A, B, and C systems.

4.2.1 Area A Dual Phase Extraction System

Routine maintenance is performed as specified or as needed, including checking the oil level of the SVE blower and air compressor, draining the air compressor, changing the bag filters, backwashing the carbon units, and skimming off LPH in the oil/water separator, if present.

Provided below is a description of the non-routine maintenance activities performed at Area A during the current period.

- Lag liquid phase GAC vessel internal piping replaced on January 29, 2016.
- Oil/water separator transfer pump discharge nipple replaced on February 4, 2016.
- Air stripper float replaced on May 4, 2016.
- Extraction well head compressed air tubing replaced on June 8, 2016.
- System temporarily shut down to replace the liquid phase GAC on January 29 and May 31, 2016.

4.2.2 Area B In-Situ Groundwater Remediation Wells

System maintenance is performed as needed or as specified. Routine maintenance includes checking and changing (when needed) cartridge filters and checking the top of the carbon for fouling and fouled carbon removal (top few inches) as needed. Non-routine maintenance activities, including pump maintenance, carbon replacement, and replacement/repair of system components, will be performed as needed.

There were no non-routine maintenance activities performed at Area B during this reporting period.

4.2.3 Area C Oxygen Reactive Zone

System maintenance is performed as needed or as specified. Non-routine maintenance activities that will be performed as needed, based on system inspection and monitoring, include cleaning of the oxygen emitters, replacing the oxygen cylinder, well maintenance, removing liquids contained in the oxygen vault sump by pumping, and replacement/repair of system components.

Provided below is a description of the non-routine maintenance activities performed at Area C.

- The oxygen cylinder was replaced on January 7 and March 17, 2016.
- The former oxygen distribution manifold was replaced with a stainless steel manifold on January 7, 2016.

4.3 System Monitoring

This section provides a summary of monitoring activities performed for the Area A, B, and C systems.

4.3.1 Area A Dual Phase Extraction System

Routine monitoring for the DPE system includes the following activities:

- Recording groundwater and air flow rates;
- Measuring air influent and effluent concentrations using a FID;
- Recording the manifold vacuum for the SVE system;
- Recording groundwater extraction system bag filter and air stripper differential pressure;
- Recording groundwater extraction system carbon influent pressures;
- Recording the SVE hour meter;
- Recording catalytic oxidizer temperatures; and
- Recording vacuum readings.

The total fluids influent (SP-1) was sampled 6 times and the treated effluent (SP-3) was sampled 12 times for laboratory analysis during the reporting period (Tables B-2 and B-3, respectively, Appendix B).

Treated effluent samples were analyzed by EPA Method 8260 for benzene, toluene, ethylbenzene, and xylenes (BTEX), methyl tert-butyl ether (MTBE), naphthalene, tetrachloroethene, trichloroethene, and 1, 2-cis-dichloroethene. Treated effluent samples were also analyzed by EPA Method 8015 for total petroleum hydrocarbons - gasoline range organics (TPH-GRO). The discharge permit limits are 100 micrograms per liter ($\mu\text{g/L}$) for total BTEX, 5 $\mu\text{g/L}$ for benzene, and 15 milligrams per liter (mg/L) for TPH-GRO. The discharge permit requires reporting of MTBE, naphthalene, tetrachloroethene (PCE), trichloroethene (TCE), and 1, 2-cis-dichloroethene (cis-1,2-DCE) concentrations without established limits. Results are documented in Section 6 of this report. On May 10, 2016, Arcadis on behalf of Chevron submitted a request to MDE Waste Management Administration to discontinue the requirement to analyze for chlorinated compounds and report chlorinated solvents in the quarterly Discharge Monitoring Report, given that analytical results of system performance groundwater samples collected

SEMI-ANNUAL PROGRESS REPORT JANUARY THROUGH JUNE 2016

since July of 2013 have demonstrated limited to no concentrations of these constituents in the system influent. A response to this request has not been received to date.

The air stripper vapor phase GAC influent (SP-50) air was sampled 5 times and the air stripper vapor phase GAC effluent (SP-52) air was sampled 6 times for laboratory analysis during the reporting period (Tables B-4 and B-5, respectively, Appendix B). Samples were analyzed for BTEX, MTBE, and total recoverable petroleum hydrocarbons (TRPH), reported as GRO in the C4 to C10 range, using EPA Method TO-15. The air stripper permit discharge limits are 20 pounds of volatile organic compounds (VOCs) per day and 0.02 pounds of benzene per hour. Results are documented in Section 6 of this report.

The SVE system influent (SP-100) air was sampled 6 times and the SVE treated effluent (SP-200) air was sampled 6 times for laboratory analysis during the reporting period (Tables C-2 and C-3, respectively, Appendix C) to document compliance with the air discharge permit. The treated effluent air sampling port is located in the catalytic oxidizer effluent stack before discharge to the atmosphere. Samples were analyzed for BTEX, MTBE, and TRPH, reported as GRO in the C4 to C10 range, using EPA Method TO-15. The SVE system permit discharge limits are 20 pounds of VOCs per day and 0.02 pounds of benzene per hour. Results are documented in Section 6 of this report.

4.3.2 Area B In-Situ Groundwater Remediation Wells

Routine monitoring for the ISGR wells includes the following activities:

- Recording the hour meter;
- Recording total volume pumped and the system flow rate;
- Recording influent pressure; and
- Recording the pump set point, temperature, speed, power input, power consumption, operating hours, and starts.

Liquid phase GAC performance samples were collected monthly during the reporting period. Since startup and throughout the reporting period, analysis of samples collected from the 50% carbon sample port of both wells have been non-detect.

Liquid phase GAC performance samples will continue to be collected on a monthly basis to determine the carbon exhaustion rate. The time between system start-up and detection of hydrocarbons at the 75% sample port will be evaluated to calculate when hydrocarbons will be detected in the 90% sample port. The carbon change out for ISGR-1 and ISGR-2 will be scheduled prior to the calculated date when the 90% sample port is expected to be impacted. Table D-2 in Appendix D provides a summary of the analysis results for the liquid phase GAC performance samples collected from ISGR-1 and ISGR-2.

4.3.3 Area C Oxygen Reactive Zone

Routine monitoring for the ORZ system includes the following activities:

- Recording oxygen cylinder pressure;
- Recording system pressure;
- Recording oxygen sensor reading; and

- Recording pressure at each well.

DO is measured in all injection wells (IW-1 through IW-5), MW-26A, MW-26B, and MW-58 on a quarterly basis. Table E-2 in Appendix E provides a summary of the DO measurements for the Area C ORZ. DO measurements were collected on March 24 and June 28, 2016.

Oxygen cylinder usage is tracked to evaluate system consumption and to monitor for cylinder replacement. Based on data collected to date and cylinder replacement frequency, normal cylinder life is estimated at 6 months. The oxygen cylinder was last replaced on March 17, 2016 and as a result of a premature depletion due to a small leak, is currently planned for replacement on July 26, 2016. A new cylinder typically has a pressure of 1,800 pounds per square inch (psi) with an approximate capacity of 1,700 liters or 60 cubic feet.

4.4 Site Monitoring

In a letter dated August 21, 2014 ARCADIS, on behalf of Chevron, submitted a request to the EPA for modification of the approved site groundwater sampling plan. The letter proposed a reduction in the number of wells being sampled, a modification to the frequency of sampling for specific wells, and compared the past two years of groundwater quality data to Maximum Contaminant Levels established for the site. The review also considered the location and usefulness of related monitoring wells with respect to future plume modeling. In a letter dated September 2, 2014, the EPA approved the proposed modification to the site groundwater sampling plan.

The EPA-approved Interim Monitoring Sampling Plan calls for monthly gauging of ten monitoring wells (GP-27R, GP-30A, GP-35A, MP-7, MW-7, MW-16, MW-18, MW-22R, MW-24A, and RW-4), semi-annual gauging of all monitoring wells, semi-annual sampling of 41 monitoring wells, annual sampling of 27 monitoring wells, and semi-annual sampling of the four soil vapor wells (VW-1, VW-2, VW-3, and VW-4). Table 1 provides a summary of the newly approved groundwater and soil vapor sampling plan.

4.4.1 Groundwater Monitoring

Monthly groundwater gauging of the ten specified monitoring wells was conducted on January 5, February 22, March 28, April 4, May 31, and June 13, 2016. The spring semi-annual groundwater gauging was conducted on March 23, 2016. The groundwater gauging/elevation data for the past two years is provided on Table F-1 of Appendix F. A detailed explanation of the table is provided on the first page of Appendix F. Groundwater contour maps, provided as Figures 2 and 3, were created using gauging data collected during the spring semi-annual groundwater gauging event. Results are summarized in Section 6 of this report.

The spring semi-annual sampling event for the Maryland and D.C. monitoring wells was conducted during the period of April 11 through April 13, 2016. The analytical results for groundwater sampling events for the past two years are provided on Table F-2 of Appendix F. A detailed explanation of the table is provided on the first page of Appendix F. Groundwater iso-concentration maps, provided as Figures 4 through 7, were created using analytical results from the spring 2016 sampling event. Figures 8 through 25 present the benzene and MTBE trend analyses for select wells.

A Mann-Kendall statistical analysis will be performed in the fall of 2016 upon completion of the fall 2016 groundwater sampling event. The results of this analysis, to include the evaluation of spring and fall 2016 groundwater sample analysis results, will be provided for the next reporting period (July 1 through

SEMI-ANNUAL PROGRESS REPORT JANUARY THROUGH JUNE 2016

December 31, 2016). Results of the Mann-Kendall statistical analysis will be documented in Section 6 of this report.

4.4.1.1 In-Situ Groundwater Remediation Wells

To evaluate system performance, groundwater samples for analysis of VOCs and TPH-GRO, are collected from MW-61A, MW-61B, MW-62A, MW-62B, and the influent (shallow piezometer) and effluent (deep piezometer) of the ISGR wells during the on-going semi-annual long-term monitoring program. Analytical results for groundwater samples collected from the Area B system performance wells during the spring 2016 semi-annual sampling event are provided on Table F-2 of Appendix F.

The influent (ISGR-1 Shallow and ISGR-2 Shallow) and effluent (ISGR-1 Deep and ISGR-2 Deep) of the ISGR wells were added to Table 1 for inclusion in the long-term monitoring program.

4.4.1.2 Oxygen Reactive Zone

To evaluate system performance, groundwater samples for analysis of VOCs and TPH-GRO, are collected from wells MW-58, MW-59, MW-60, MW-26A, and MW-26B during the ongoing semi-annual long-term monitoring program. Analytical results for groundwater samples collected from the Area C system performance wells during the spring 2016 semi-annual sampling event are provided on Table F-2 of Appendix F.

4.4.2 Passive Sampling Using the HydraSieve™

The use of HydraSieve passive samplers was approved by DOEE and EPA for use during the spring 2016 semi-annual groundwater sampling event. Groundwater samples were collected from 8 wells (MW-27A, GP-30A, GP-35A, MW-61A, ISGR-1 Shallow, ISGR-1 Deep, ISGR-2 Shallow, and ISGR-2 Deep) using the HydraSieve passive samplers.

4.4.3 Soil Vapor Monitoring

Semi-annual soil vapor sampling of 1 (VW-1) of the 4 soil vapor wells as well as an ambient sample for VW-1 was conducted on May 9, 2016. Wet weather conditions prevented sample collection (i.e., infiltration of precipitation fills soil pore spaces and inhibits soil vapor flow) from three of the soil vapor wells (VW-2, VW-3, and VW-4). Analytical results for soil vapor samples collected during the May 2016 semi-annual soil vapor sampling event are provided on Table G-1 of Appendix G.

5 SUBMITTAL OF DELIVERABLES

Chevron submitted the following deliverables to EPA during the reporting period:

- Semi-Annual Progress Report for July through December 2015 in January 2016.
- Letter submitted to MDE and EPA on May 10, 2016 to request a modification to the required analyte list for the Maryland Department of the Environment General Discharge Permit No. 2008-OGR-8514 (National Pollutant Discharge Elimination System Permit No. MDG918514).

6 SUMMARY OF FINDINGS

This section provides a summary of findings and results for the OMM activities performed during the reporting period.

6.1 Area A Dual Phase Extraction System

The groundwater extraction portion of the DPE system pumped approximately 1,988,105 gallons of groundwater and recovered 9.47 equivalent gallons of dissolved hydrocarbons during the reporting period. The average system flow rate over the entire period was 7.66 gpm. The total volume of groundwater pumped from this site since remediation began in 1989 is approximately 70,862,923 gallons.

The analytical results for groundwater samples collected from sample point SP-3 (treated groundwater that is discharged to the storm drain) (Table B-3 of Appendix B) indicated concentrations of benzene, BTEX, and TPH-GRO in the treated groundwater were below the permit limits (5 µg/L benzene, 100 µg/L BTEX, and 15 mg/L for TPH-GRO) during the reporting period.

The laboratory analytical results for monthly air stripper samples collected at sample points SP-50 (air stripper vapor phase GAC influent) (Table B-4 of Appendix B) and SP-52 (air stripper vapor phase GAC effluent to atmosphere) (Table B-5 of Appendix B) indicated concentrations of benzene and TRPH in the treated vapor were below the permit limits. The permit limits are 0.02 pounds per hour of benzene and 20 pounds per day of VOCs measured as TRPH.

The SVE portion of the DPE system recovered 86.78 equivalent gallons of hydrocarbons in the vapor phase during the reporting period. The average air flow rate was 86.78 standard cubic feet per minute when the system was on (excluding down time).

Note that a correction has been made to the Vapor Phase Hydrocarbon (equivalent gallons) Cumulative Total for System. During the July 1 through December 31, 2015 reporting period, the analytical results from the December 18, 2015 sampling event were mistakenly not included in the Semi-Annual Report. An additional 9.4 equivalent gallons of Vapor Phase Hydrocarbons has been added to the Cumulative Total for System.

The laboratory analytical results for monthly SVE system samples collected at sample points SP-100 (soil vapor influent) (Table C-2 of Appendix C) and SP-200 (soil vapor effluent to atmosphere) (Table C-3 of Appendix C) indicated concentrations of benzene and TRPH in the treated soil vapor were below the permit limits. The permit limits are 0.02 pounds per hour of benzene and 20 pounds per day of VOCs measured as TRPH.

Hydrocarbon Recovery Summary for Period of Cumulative Total for System

Period	Liquid Phase Hydrocarbons (gallons)	Dissolved Phase Hydrocarbons (eq. gallons)	Vapor Phase Hydrocarbons (eq. gallons)	Cumulative Total Hydrocarbons (eq. gallons)
1/1/16 through 6/30/16	0.00	9.47	86.78	96.25
Cumulative Total for System	856.5	993.77	6,598.38	8,448.65

The volume of groundwater treated and the corresponding volume of hydrocarbons collected for the entire time the system has been operating on a quarter by quarter basis continued to be tracked (Figure 1).

6.2 Area B In-Situ Groundwater Remediation Wells

ISGR-1 and ISGR-2 have continued to consistently operate throughout the reporting period. The long term effects of the Area B ISGR wells on reducing the concentration of petroleum hydrocarbons in groundwater will continue to be evaluated. The carbon consumption rate for both ISGR wells has continued to be minimal with no detectable levels of petroleum hydrocarbons measured in the 50% sampling port of the liquid phase GAC of either well. System optimization will be performed as required based on observed system performance.

6.3 Area C Oxygen Reactive Zone

The long term effects of the Area C ORZ system on reducing the concentration of petroleum hydrocarbons in groundwater will require continued system operation and sample analysis evaluation over a longer period of time. System optimization will be performed as required based on observed system performance. DO measurements will continue to be collected on a quarterly basis to verify DO delivery to the subsurface. Emitter cleaning and well maintenance will be performed as required.

6.4 Mann-Kendall Statistical Analysis

A Mann-Kendall statistical analysis will be performed in the fall of 2016 upon completion of the fall 2016 groundwater sampling event. The results of this analysis, to include the evaluation of spring and fall 2016 groundwater sample analysis results, will be provided for the next reporting period (July 1 through December 31, 2016).

6.5 Groundwater Elevation Summary

Groundwater gauging measurements from the spring 2016 semi-annual groundwater gauging event indicate that groundwater flow direction is consistent with past observations. Groundwater contour maps representing the spring 2016 semi-annual groundwater gauging event are provided as Figures 2 and 3.

7 PERMIT COMPLIANCE

Permits required for activities during this reporting period are described below.

7.1 Permits for Operation of the Area A System

MDE Air Quality General Permit for Groundwater Air Stripping effluent, permit number 033-9-1160 and MDE Air Quality General Permit for Soil Vapor Extraction Equipment effluent, permit number 033-9-1164 were required. Neither of these permits has an expiration date. Sampling and monitoring requirements include periodic effluent monitoring as previously described.

MDE General Discharge Permit, permit number 2008-OGR-8514 (NPDES Permit No. MDG918514) was issued for discharge of treated groundwater at the site. This permit became effective on November 1, 2013 and expires on December 11, 2017. Based on current system effluent flow (less than 500,000 gallons per month), the permit requires effluent sampling twice per month, system monitoring, and submission of a quarterly Discharge Monitoring Report. Two treated groundwater effluent (SP-3) samples were collected and analyzed each month during the reporting period.

7.2 Permits for Groundwater Monitoring and Operation of Area B and C Systems

Permit number PA10197033 for Public Space Occupancy was issued by the District Department of Transportation on January 9, 2016 to cover traffic control requirements for sampling, gauging, and OMM in Areas B and C until July 6, 2016. A new permit is applied for and issued on a semi-annual basis.

8 SUMMARY OF DEVIATIONS FROM APPROVED PLANS, PROBLEMS ENCOUNTERED, AND CORRECTIVE ACTIONS TAKEN

8.1 System Sampling/Monitoring

Provided below are the samples not collected during the reporting period and a brief justification:

- June: Sample collected from the vapor phase GAC influent sample tap (SP-50) was not analyzed due to the sample bag being deflated upon arrival at the lab.

8.2 Soil Vapor Sampling

Provided below are the samples not collected during the reporting period and a brief justification:

- May: Soil vapor samples were not collected from VW-2, VW-3, and VW-4 due to wet weather conditions. Water was observed in each of these wells and sample collection was not possible.

9 SUMMARY OF MEETINGS WITH PUBLIC AND GOVERNMENT

No meetings with the public or government officials occurred during the reporting period.

10 CHANGES IN KEY PERSONNEL DURING THE REPORTING PERIOD

No changes in key personnel during the reporting period to report.

11 PROJECTED WORK FOR THE NEXT REPORTING PERIOD

The following list identifies projected work anticipated to be performed during the next reporting period, July through December 2016:

- Routine operations and maintenance activities for the Area A, B, and C remediation systems;
- Monthly sampling of the Area A DPE system including influent and effluent sampling;
- Sampling of the Area A DPE system effluent twice per month to comply with treated water discharge permit;
- Monthly gauging of select wells near the service station to check for the presence of LPH and to document drawdown induced by the total fluids extraction system;
- Area A liquid phase GAC replacement;
- Monthly Area A system optimization;
- Pull, inspect, and clean (as needed) pneumatic pumps in Area A;
- Clean oil water separator (as needed);
- Continue optimization of the Area B ISGR wells to maintain uptime;
- Area B monthly liquid phase GAC performance sampling;
- Area B liquid phase GAC replacement (as warranted) planning;
- Area C oxygen cylinder change out;
- Area C oxygen emitter pulling and cleaning (as needed);
- Area C quarterly DO measurement collection;
- Semi-annual groundwater sampling and gauging event in the fall of 2016; and
- System maintenance on Area A, B, and C systems as required.

APPENDIX B

DUAL PHASE EXTRACTION SYSTEM-TOTAL FLUIDS EXTRACTION DATA

APPENDIX B
DUAL-PHASE EXTRACTION SYSTEM –
TOTAL FLUIDS EXTRACTION DATA

DESCRIPTION OF DATA TABLES

Chevron uses a central database to store remediation system data and laboratory analytical data. The tabulated data in Tables A-1, A-2, A-3, A-4, and A-5 is an exported summary of the total fluids extraction system data from the database. These data were recorded by the field technician during site visits. The analytical data for influent samples collected for laboratory analysis (Table A-2) are used to calculate the mass (and to estimate the volume) of hydrocarbons recovered in the dissolved phase. Effluent sample data are included in Table A-3 for comparison with permit limits.

The data table includes recent system data. Historical data collected are available in previous progress reports.

The following table lists the column headings in the table with a brief description of each. Please refer to the piping and instrumentation Diagram (Appendix H) for a schematic of equipment and sample ports.

Column Heading	Description
Date / Time	Date and time data were recorded.
System Status	System ON or OFF when technician recorded the data.
Influent BTEX (µg/L)	Sum of benzene, toluene, ethylbenzene, and total xylenes from influent sample port SP-1.
Effluent BTEX (µg/L)	Sum of benzene, toluene, ethylbenzene, and total xylenes from effluent sample port SP-3.
Treatment Efficiency (%)	Equation: (Influent-Effluent) / (Influent).
Totalizer Reading (gallons)	Reading on the totalizing flow meter.
Pumped Period (gallons)	Equation: (current totalizer reading) – (previous totalizer reading).
Pumped Total (gallons)	Cumulative total gallons of groundwater recovered.
Period Average (GPM)	Equation: (Gallons Pumped During Period) / (current Date-Time – previous Date-Time)
Hydrocarbons Recovered Period (gallons) ¹	Equation: [Avg. Influent BTEX (ug/L)] * e^6 * (1/0.2) * (3.785 L/gal) * (1 lb/453.6 g) * (gallons pumped) * (1 gal/6.26 lbs). NOTE: Formula assumes BTEX equals 20% of gasoline.
Hydrocarbons Recovered Cumulative (gallons)	Equation: (Hydrocarbons Recovered During Period) + (Previous Cumulative)
Operating Extraction Points	Wells in operation during the reporting period.

Notes:

(1) Assumptions: BTEX is 20% of hydrocarbon product by volume; density of hydrocarbon product is 6.26 pounds/gallon. The Average (Avg.) Influent BTEX concentration is defined as the mean of the influent concentration for the current and previous sampling events.

6/28/16 9:14	ON	NS	0	0.0	58,158,001	179937	70,862,923	8	-	993.77	MW-7, RW-1, RW-2, RW-3, RW-4, RW-5, MW-17, MW-22R, GP-39R, GP-27R, PTW-B

Notes:

(1) Hydrocarbons Recovered Period (gallons) = (avg. inf. conc.) x (e-6) x (1/0.2) x (3.785 L/gal) x (1 lb/453.6 g) x (gallons pumped) x (1 gal/6.26 lbs).

(2) Formula assumes BTEX equals 20% of gasoline.

Notes:

- (1) Pursuant to permit compliance verification, flow values were assumed to be maximum possible (280 CFM) for 7/2/2012 data and thereafter. Efforts are currently being made to calculate actual flow data. Reported valves will be updated following calculation of actual flow.

Notes:

(1) Pursuant to permit compliance verification, flow values were assumed to be maximum possible (280 CFM) for 7/2/2012 data and thereafter. Efforts are currently being made to calculate actual flow data. Reported values will be updated following calculation of actual flow.

APPENDIX C

DUAL PHASE EXTRACTION SYSTEM-SOIL VAPOR EXTRACTION DATA

APPENDIX C
DUAL-PHASE EXTRACTION SYSTEM –
SOIL VAPOR EXTRACTION DATA

DESCRIPTION OF DATA TABLES

Overview

Chevron uses a central database to store remediation system data and laboratory analytical data. The tabulated data in Tables B-1, B-2 and B-3 is an exported summary of soil vapor extraction system data from the database. These data were recorded by the field technician during site visits. Analytical data for influent samples collected for laboratory analysis are included in Table B-2 to calculate the mass recovery rates of total petroleum hydrocarbons and benzene. Effluent sample data are included in Table B-3 for comparison with permit limits.

The data table includes recent system data. Historical data collected are available in previous progress reports.

The following table lists the column headings in the table with a brief description of each. Please refer to the piping and instrumentation Diagram (Appendix H) for a schematic of equipment and sample ports.

Column Heading	Description
Date / Time	Date and time data were recorded.
System Status	System ON or OFF when technician recorded the data.
Hour Meter (hours)	Field measurement of the hour meter.
Manifold Vacuum (in Hg)	Field measurement of vacuum in manifold.
Influent (ppmv)	Field measurement of vapor concentration prior to treatment using a photoionization detector.
Influent (cfm)	Field measurement of total vapor flow in manifold.
Effluent (ppmv)	Field measurement of vapor concentration after treatment using a photoionization detector.
Treatment Efficiency (%)	Equation: (Influent-Effluent) / (Influent).
Hydrocarbons Recovered (lbs/day) ¹	Equation: [(Influent) / (10 ⁻⁶) * [Manifold Extraction-Flow Rate] * CV1
Hydrocarbons Recovered Period (gal)	Equation: [(Avg. Influent) x (10 ⁻⁶) * [Avg. Manifold Extraction-Flow Rate]
Hydrocarbons Recovered Cumulative (gal)	Equation: (Avg. Influent BTEX) * (1 L / 0.26 gal) * (lb/454x10 ⁶ µg) * (current Total Gallons Pumped – previous Total Gallons Pumped on last sampling date) * (gal hydrocarbons / 6.48 lbs hydrocarbons) * (0.2 gal BTEX / gal hydrocarbons).
Operating Extraction Points	Wells in operation during the reporting period.

Notes:

- (1) Assumptions: Hydrocarbon molecular weight is 92 grams/mole; vapor behaves like an ideal gas; Average (Avg.) Influent (ppmv) and flow rate (Manifold Extraction in the table) are averages between the current and last events. Unit conversion factors (CV) equations are:

$$CV1 = (92 \text{ grams/mole}) * (1 \text{ mol}/24.45 \text{ L}) * (28.32 \text{ L}/\text{ft}^3) * (1440 \text{ min}/\text{day}) * (1 \text{ lb}/454 \text{ grams}) = 338 \text{ min}^*\text{lbs}/\text{day}.$$

$$CV2 = (92 \text{ grams/mole}) * (1 \text{ mol}/24.45 \text{ L}) * (28.32 \text{ L}/\text{ft}^3) * (\text{Runtime in minutes}) * (1 \text{ lb}/454 \text{ grams}) = 0.235 \text{ min}^*\text{lbs}.$$

TABLE D-2: CARBON PERFORMANCE ANALYTICAL RESULTS
SEMI-ANNUAL PROGRESS REPORT: JANUARY THROUGH JUNE 2016
FORMER CHEVRON FACILITY 122208, 5801 RIGGS ROAD, CHILLUM, MD

ID	Date	Benzene (µg/L)	Toluene (µg/L)	Ethylbenzene (µg/L)	Total Xylenes (µg/L)	Naphthalene (µg/L)	MTBE (µg/L)	TPH-GRO (µg/L)
----	------	-------------------	-------------------	------------------------	-------------------------	-----------------------	----------------	-------------------

Notes

1. Non-detect concentration values were represented as half of the respective Minimum Detection Level as identified in the laboratory analytical reports (5 µg/l) for the Total Xylenes concentration calculation
2. NA = Not Analyzed

APPENDIX F

GROUNDWATER MONITORING DATA

APPENDIX F

GROUNDWATER MONITORING DATA

DESCRIPTION OF DATA TABLE

Overview

Chevron uses a central database to store groundwater monitoring data including laboratory analytical data. The tabulated data in Appendix C (Tables C-1 and C-2) are exported summaries of groundwater elevation data and analytical data for the past two years. Groundwater elevation data were measured using an interface probe in wells near the service station and a water level indicator at all other locations.

The following table lists the column headings in the table with a brief description of each.

Column Heading	Description
Date of Measurement	Date data were recorded.
Depth to Water (feet)	Depth to groundwater (ft)
TOC Elevation (feet)	Top of casing elevation (ft)
Water Table Elevation (feet)	Corrected water table elevation equation: (TOC) – (Depth to Water) + [(0.75)*(LPH Thickness)]
Depth to LPH (feet)	Depth to LPH (feet)
LPH Thickness (feet)	Equation: (Depth to Water-Depth to LPH)
LPH Elevation (feet)	Equation: (TOC-Depth to LPH)
Benzene ($\mu\text{g}/\text{L}$)	Laboratory reported concentration
Toluene ($\mu\text{g}/\text{L}$)	Laboratory reported concentration
Ethylbenzene ($\mu\text{g}/\text{L}$)	Laboratory reported concentration
m,p-Xylene ($\mu\text{g}/\text{L}$)	Laboratory reported concentration
o-Xylene ($\mu\text{g}/\text{L}$)	Laboratory reported concentration
Methyl-t-butyl ether ($\mu\text{g}/\text{L}$)	Laboratory reported concentration
TPH-GRO ($\mu\text{g}/\text{L}$)	Laboratory reported concentration

	4/28/2015	ND 13	ND 3.9	ND 5.2	5.7	ND 4.4	ND 5.2	5.1
	10/27/2015	ND 12	ND 3.4	ND 4.6	ND 4.6	ND 3.8	ND 4.6	ND 4.0
VW-03	10/18/2012	1,200	ND 6.8	ND 9.2	14	ND 7.6	ND 9.2	ND 8.0
VW-2(Ambient)	10/18/2012	--	ND 2.3	ND 3.1	ND 3.1	ND 2.6	ND 3.1	ND 2.7
VW-04(Ambient)	01/23/2012	--	ND 2.8	ND 3.8	ND 3.8	ND 3.2	ND 3.8	ND 3.3

Notes:

- 1) J - Estimated value
- 2) ND - Not detected at the minimum reported quantification limit
- 3) Wells VW-03 and VW-04 were not sampled during the reporting period due to the presence of water.
- 4) E - Exceeds instrument calibration range
