## **1. Introduction**

Pursuant to the U.S. Environmental Protection Agency (EPA) Administrative Order, Docket Number RCRA-03-2008-0355TH (AO), Chevron Environmental Management Company (Chevron) is conducting work at, and adjacent to, the former Chevron Service Station (Facility No. 122208) located at 5801 Riggs Road, Chillum, Maryland (the site). In accordance with Section VI, Paragraph E, subsection 3(c) of the AO, ARCADIS on behalf of Chevron has prepared this Semi-Annual Progress Report (Report) to describe actions taken by Chevron pursuant to the AO. The reporting period for this report is July through December 2014.

The remainder of this Report provides information on the following:

- Section 2.0 - System Overview
- Section 3.0 - Discontinue Operation and Maintenance of Vapor Mitigation Systems
- Section 4.0 - Operation, Maintenance, and Monitoring
- Section 5.0 - Submittal of Deliverables
- Section 6.0 - Summary of Findings
- Section 7.0 - Permit Compliance
- Section 8.0 - Summary of Deviations from Approved Plans, Problems Encountered, and Corrective Actions Taken
- Section 9.0 - Summary of Meetings with Public and Government
- Section 10.0 - Changes in Key Personnel During the Reporting Period
- Section 11.0 - Projected Work for the Next Reporting Period

## **2. System Overview**

The piping and instrumentation diagrams for the systems (Appendix G) provide specific system information, such as equipment models and sizes, piping sizes, controls, and other technical information.

### **2.1 Area A Dual Phase Extraction System**

Area A encompasses the former Chevron service station, the existing remediation system compound adjacent to the service station, and the shopping center parking lot near the intersection of Eastern Avenue and Riggs Road. Duplex residential homes are present southwest of Area A, and land use is generally commercial in all other directions. The Dual Phase Extraction (DPE) System consists of total fluids extraction and treatment and soil vapor extraction and treatment.

#### **2.1.1 Total Fluids Recovery and Treatment**

Pneumatic total fluids (i.e., groundwater and liquid phase hydrocarbons [LPH], if present) pumps are installed in 11 DPE wells (RW-1, RW-2, RW-3, RW-4, RW-5, MW-7, MW-17, MW-22R, GP-27R, GP-39R and PTW-B). Total fluids are pumped from the wells through buried piping to the total fluids manifold located in the remediation system trailer. The total fluids manifold leads to a coalescing-type oil/water separator. Level sensors in the oil/water separator control a centrifugal pump that intermittently transfers the water to an air stripper. LPH accumulate in the separator and are periodically manually skimmed off (if present). Effluent air from the air stripper is treated using two vapor phase granular activated carbon (GAC) vessels in series and then discharged to the atmosphere in accordance with Maryland Department of the Environment (MDE) Air Quality General Permit to Construct for Groundwater Air Stripping, Identification No. 033-9-1160. Treated water from the air stripper is pumped through three parallel bag filters and then through two liquid phase GAC vessels in series. The treated effluent flows through a buried pipe to a storm drain inlet located in Riggs Road near the intersection at Eastern Avenue, N.E. in accordance with MDE General Discharge Permit No. 2008-OGR-8514 (National Pollutant Discharge Elimination System [NPDES] Permit No. MDG918514).

#### **2.1.2 Soil Vapor Recovery and Treatment**

Soil vapor extraction (SVE) is conducted at 12 wells (i.e., the 11 DPE wells plus MP-7). An individual piping leg runs from each well to a common 3-inch manifold in the

remediation system trailer. The manifold leads to a moisture knockout tank and then to the blower. The blower is a rotary lobe, positive displacement blower controlled by a variable frequency drive. Soil vapor is blown from the blower to a catalytic oxidizer for treatment. Treated air is discharged to the atmosphere in accordance with MDE Air Quality General Permit to Construct for Soil Vapor Extraction Equipment, Identification No. 033-9-1164. Water collected in the knockout tank is pumped to the oil/water separator for treatment.

## **2.2 Area B In-Situ Groundwater Remediation Wells**

Area B is located in the alley between Oglethorpe Street and Eastern Avenue, NE, in Washington, D.C. (Oglethorpe Alley). The area surrounding Area B is residential, with brick duplexes and triplexes lining Oglethorpe Street and Eastern Avenue.

The Area B system consists of two in-situ groundwater remediation (ISGR) wells (ISGR-1 and ISGR-2) that are installed in the Oglethorpe Alley forming a transect along the alley. ISGR-1 and ISGR-2 were started on August 28, 2013. The objective of the ISGR wells is to remove dissolved hydrocarbon mass from groundwater in Area B by adsorption to liquid phase GAC.

For each ISGR well, water that enters the shallow aquifer inlet screen, which is placed at an appropriate depth to intersect dissolved hydrocarbons, is pumped through liquid phase GAC to remove hydrocarbons to non-detect levels. The treated water is released by gravity to the deep aquifer through an outlet screen in the same well. The targeted pumping rate in each well is 1 to 2 gallons per minute (gpm), depending on the aquifer response.

The submersible pump is operated by a control panel mounted on a base with the electrical power (utility) meter. The pump is driven by a controller, which controls the speed of the pump, depending on observed system performance and operator input. The pumping rate can be adjusted over a range of approximately 1 to 10 gpm.

## **2.3 Area C Oxygen Reactive Zone**

Area C is located in the alley between Oglethorpe and Nicholson Streets, NE, in Washington, D.C. (Nicholson Alley). The area surrounding Area C is residential, with brick duplexes and triplexes lining Nicholson and Oglethorpe Streets.

The objective of the oxygen reactive zone (ORZ) is to increase the concentration of dissolved oxygen (DO) in the subsurface of the Nicholson Alley to stimulate the growth of native microbes that use oxygen to degrade dissolved petroleum hydrocarbons. The intent of the system is the reduction of dissolved hydrocarbons downgradient of Area C through the biotransformation of dissolved hydrocarbons by aerobic microbes. The Area C ORZ system was started on August 29, 2013.

Five oxygen injection wells (IW-1 through IW-5) are installed in the Nicholson Alley. The locations of the wells and vertical positions of the well screens correspond to the areas of highest petroleum hydrocarbon concentrations as determined from previous site investigation activities. Oxygen hoses are routed in and out of each well vault through polyvinyl chloride (PVC) inlet and outlet conduits. An oxygen emitter is installed in each injection well within the screened intervals of the wells.

Oxygen is supplied to the oxygen emitters by an oxygen cylinder housed in a permit required confined space pre-cast concrete vault installed below grade in the Nicholson Alley. The vault is located in line with, and centered between, injection wells IW-1 and IW-2 and is equipped with a floor sump, a passive ventilation system, and a continuous monitoring oxygen detector to monitor for oxygen leakage.

### **3. Discontinued Operation and Maintenance of Vapor Mitigation Systems**

Based on Section 5.7 of the approved Interim Measures Work Plan for Vapor Sampling and Mitigation, if the data trend over three consecutive years suggests that continuous operation of any vapor mitigation system (VMS) installed is no longer necessary to protect human health, Chevron may petition EPA for system termination review.

Chevron submitted a letter dated November 7, 2013 to EPA to formally request a termination review and EPA approval that operation and maintenance of the three VMS units located at 746 Oglethorpe Street, 5818 Eastern Avenue, and 5824 Eastern Avenue Washington, D.C. be discontinued. In a letter dated January 9, 2014, the EPA approved Chevron's request to discontinue operation and maintenance of the three VMS units.

In response to the approval, the residence owners at 746 Oglethorpe Street and 5818 Eastern Avenue were contacted by Chevron in February 2014 and informed that per the 2010 Final Remedy and as detailed in the 2010 Homeowner Report (that the resident owners previously received from the District Department of the Environment [DDOE]), they were deemed eligible to receive a VMS from the DDOE and they should not remove the VMS currently installed in their home. Following confirmation of receipt of this correspondence, the DDOE was to contact the resident owners to coordinate future operation and maintenance events.

Additionally, in response to the approval, the residence owner at 5824 Eastern Avenue, who was deemed not eligible to receive a VMS from the DDOE (per the 2010 Final Remedy), was consulted (by Chevron) in February 2014 to determine whether the system will be removed from the building or left in place. No request for the removal of the system at 5824 Eastern Avenue has been received to date, therefore; the system will be left in place, and the residence owner is responsible for all costs (including electricity) associated with further maintenance and operation of the system.

Notification letters, inclusive of the EPA approval date and the information discussed above, were submitted to each resident via certified mail.

## **4. Operation, Maintenance, and Monitoring**

This section provides a summary of operation, maintenance, and monitoring (OMM) activities conducted at the site during the reporting period.

### **4.1 System Operation**

This section provides a summary of operations for Area A, B, and C systems and includes a discussion on system uptime and downtime and other related operational points of discussion.

A description of the routine OMM requirements for Areas A, B, and C, are provided in the following sections.

#### **4.1.1 Area A Dual Phase Extraction System**

Routine OMM site visits to record measurements and collect samples are performed every other week (2/month). The reduction from weekly routine OMM visits to every other week is based on permit requirements to collect two effluent samples per month for an Area A effluent flow to the municipal storm drain of less than 500,000 gallons per month. Additional visits are made to the site each month for specific maintenance needs and to respond to system alarms as needed.

The operating hours for both the total fluids and SVE portions of the DPE system were logged regularly during the reporting period by collecting measurements from the solenoid and hour meter, respectively. For the period of July 1, 2014 through December 31, 2014, the total fluids extraction portion of the system was operating 71 percent of the time (3,128 hours on and 1,288 hours off). During the same time period, the SVE portion of the system was operating 60 percent of the time (2,650 hours on and 1,766 hours off).

Table A-1 in Appendix A contains total fluids extraction system data including date and time, on/off status, totalizer reading, cumulative gallons of hydrocarbons recovered, operating extraction points, maintenance information, reasons for system downtime, and types of maintenance performed during this reporting period and the previous period (January 1, 2014 through June 30, 2014). A detailed explanation of the tables is provided on the first page of Appendix A.

Table B-1 in Appendix B contains soil vapor extraction system data including date and time, on/off status, hour meter readings, manifold air flow readings, manifold vacuum readings, influent and effluent screening concentrations measured using a flame ionization detector (FID), cumulative gallons of hydrocarbons recovered, operating extraction points, maintenance information, reasons for system downtime, and types of maintenance performed during this reporting period and the previous period (January 1, 2014 through June 30, 2014). A detailed explanation of the tables is provided on the first page of Appendix B.

#### 4.1.2 Area B In-situ Groundwater Remediation Wells

Routine OMM visits to Area B were conducted monthly or as needed to check system operation status, to collect carbon performance samples, and record system data.

The operating hours for both ISGR wells were logged regularly during the reporting period by collecting measurements from the hour meters during each visit. In May 2014 a phone line connection was installed at Area B to improve system uptime/downtime monitoring. Programming of the existing programmable logic controller (PLC) for each ISGR well to send notification of system shutdown was completed in June 2014. For the period of July 1, 2014 through December 31, 2014, ISGR-1 was operating 92 percent of the time (3,744 hours on and 309 hours off). During the same time period, ISGR-2 was operating 71 percent of the time (2,876 hours on and 1,178 hours off).

Table E-1 in Appendix E contains ISGR monitoring data for each well including date and time, on/off status, hour meter reading, total gallons pumped, system flow, influent pressure, and pump operating hours.

#### 4.1.3 Area C Oxygen Reactive Zone

Routine OMM visits to Area C were conducted monthly or as needed to check system operation status, to collect DO measurements, and record system data. DO measurements are collected on a quarterly basis from the specified wells.

For the period of July 1, 2014 through December 31, 2014, the ORZ system continuously operated with the exception of an approximate 1 week down time period in September associated with cylinder depletion and replacement.

Table F-1 in Appendix F contains ORZ monitoring data including date and time, on/off status, oxygen cylinder pressure, cylinder regulator pressure, well regulator pressure and vault oxygen sensor reading.

## **4.2 System Maintenance**

This section provides a summary of routine and non-routine maintenance activities performed for the Area A, B, and C systems.

### **4.2.1 Area A Dual Phase Extraction System**

Routine maintenance is performed as specified or as needed, including checking the oil level of the SVE blower and air compressor, draining the air compressor, changing the bag filters, backwashing the carbons, and skimming off LPH in the oil/water separator, if present.

Provided below is a description of the non-routine maintenance activities performed at Area A.

- Replaced knock out tank transfer pump and downstream piping and check valve on July 17, 2014. Knock out tank transfer pump failure due to downstream stuck check valve found in knock out tank transfer pump discharge piping.
- Replaced broken threaded nipple fitting on discharge of oil/water separator transfer pump with identical part on August 13, 2014.
- Replaced the inlet and outlet nipple fittings of oil/water separator transfer pump with galvanized threaded nipple fittings on August 19, 2014.
- Oil/water transfer pump (pump end only) replaced on August 27, 2014.
- The liquid phase GAC for both Area A vessels was replaced with new virgin carbon on October 3, 2014.
- During carbon change out on October 3, 2014 drain port fitting of one of the liquid phase carbon vessels broke while closing valve. Drain port fittings for both Area A liquid phase GAC vessels replaced on October 8, 2014.

- Oil/water separator transfer pump shaft coupler sheared, shaft coupler replaced on October 31, 2014.
- Vibration dampeners for oil/water separator transfer pump replaced on December 9, 2014.
- Cracked tee at sample tap SP-2 was replaced on December 12, 2014.

#### 4.2.2 Area B In-situ Groundwater Remediation Wells

System maintenance is performed as needed or as specified. Routine maintenance includes checking and changing (when needed) cartridge filters and checking the top of the carbon for fouling and fouled carbon removal (top few inches) as needed. Non-routine maintenance activities, including pump maintenance, carbon replacement, and replacement/repair of system components, will be performed as needed.

Non-routine maintenance was not required at Area B during the reporting period.

#### 4.2.3 Area C Oxygen Reactive Zone

System maintenance is performed as needed or as specified. Non-routine maintenance activities that will be performed as needed, based on system inspection and monitoring, include cleaning of the oxygen emitters, replacing the oxygen cylinder, well maintenance, removing liquids contained in the oxygen vault sump by pumping, and replacement/repair of system components.

The oxygen cylinder was replaced on September 23, 2014.

### 4.3 System Monitoring

This section provides a summary of monitoring activities performed for the Area A, B, and C systems.

#### 4.3.1 Area A Dual Phase Extraction System

Routine monitoring for the DPE system includes the following activities:

- Recording groundwater and air flow rates;

- Measuring air influent and effluent concentrations using a FID;
- Recording the manifold vacuum for the SVE system;
- Recording groundwater extraction system bag filter and air stripper differential pressure;
- Recording groundwater extraction system carbon influent pressures;
- Recording the SVE hour meter;
- Recording catalytic oxidizer temperatures; and
- Recording vacuum readings.

The total fluids influent (SP-1) was sampled 6 times and the treated effluent (SP-3) was sampled 12 times for laboratory analysis during the reporting period (Tables A-2 and A-3, respectively, Appendix A). Treated effluent samples were analyzed by EPA Method 8260 for benzene, toluene, ethylbenzene, and xylenes (BTEX), methyl tert-butyl ether (MTBE), naphthalene, tetrachloroethene, trichloroethene, and 1, 2-cis-dichloroethene. Treated effluent samples were also analyzed by EPA Method 8015 for total petroleum hydrocarbons - gas range organics (TPH - GRO). The permit limits are 100 micrograms per liter ( $\mu\text{g/L}$ ) for total BTEX, 5  $\mu\text{g/L}$  for benzene, and 15 milligrams per liter ( $\text{mg/L}$ ) for TPH-GRO. The discharge permit requires reporting of MTBE, naphthalene, tetrachloroethene, trichloroethene, and 1, 2-cis-dichloroethene concentrations without establishing limits.

Analysis of the air stripper effluent air was performed 6 times during the reporting period (Appendix A). Air samples were collected before (SP-50) and after (SP-52) vapor phase GAC treatment. Due to laboratory analyzer contamination issues, the air samples collected from SP-50 and SP-52 for the month of August 2014 were not analyzed or reported. Samples were analyzed for BTEX, MTBE, and total recoverable petroleum hydrocarbons (TRPH), reported as GRO in the C4 to C10 range, using EPA Method TO-15. The air permit discharge limits are 20 pounds of volatile organic compounds per day and 0.02 pounds of benzene per hour.

Analysis of the SVE system influent (SP-100) and effluent (SP-200) air was performed 6 times during the reporting period to document compliance with the air discharge permit (Appendix B). Due to laboratory analyzer contamination issues, the air samples

collected from SP-100 and SP-200 for the month of August 2014 were not analyzed or reported. The treated effluent air sampling port (SP-200) is located in the catalytic oxidizer effluent stack before discharge to the atmosphere. Samples were analyzed for BTEX, MTBE, and TRPH, reported as GRO in the C4 to C10 range, using EPA Method TO-15. The air permit discharge limits are 20 pounds of volatile organic compounds per day and 0.02 pounds of benzene per hour.

#### 4.3.2 Area B In-situ Groundwater Remediation Wells

Routine monitoring for the ISGR wells includes the following activities:

- Recording the hour meter;
- Recording total volume pumped and the system flow rate;
- Recording influent pressure; and
- Recording the pump set point, temperature, speed, power input, power consumption, operating hours, and starts.

GAC performance samples were collected monthly during the reporting period. Since startup and throughout the reporting period, analysis of samples collected from the 50% carbon sample port have been non-detect. GAC performance samples will continue to be collected on a monthly basis to determine the carbon exhaustion rate. The time between system start-up and detection of hydrocarbons at the 75% sample port will be evaluated to calculate when hydrocarbons will be detected in the 90% sample port. The carbon change out for ISGR-1 and ISGR-2 will be scheduled prior to the calculated date when the 90% sample port is expected to be impacted. Table E-2 in Appendix E provides a summary of the analysis results for the GAC performance samples collected from ISGR-1 and ISGR-2.

#### 4.3.3 Area C Oxygen Reactive Zone

Routine monitoring for the ORZ system includes the following activities:

- Recording oxygen cylinder pressure;
- Recording tank and well regulator pressure;

- Recording oxygen sensor reading; and
- Recording well pressure.

DO is measured in all injection wells (IW-1 through IW-5), MW-26A, MW-26B, and MW-58 on a quarterly basis. Table F-2 in Appendix F provides a summary of the DO measurements for the Area C ORZ.

Oxygen cylinder usage is tracked to evaluate system consumption and to monitor for cylinder replacement. Based on data collected to date and cylinder replacement frequency, cylinder life is estimated at 6 months. The oxygen cylinder was last replaced on September 23, 2014 with a new cylinder pressure of 1,800 pounds per square inch (psi) (approximate capacity of 1,700 liters or 60 cubic feet). At the end of the reporting period (December 22, 2014) approximately 1,000 psi remained in the cylinder.

#### **4.4 Site Monitoring**

In a letter dated August 21, 2014 ARCADIS, on behalf of Chevron, submitted a request to the EPA for modification of the approved site groundwater sampling plan. The letter proposed a reduction in the number of wells being sampled, a modification to the frequency of sampling for specific wells, and presented the findings of a review that compared the past two years of groundwater quality data to Maximum Contaminant Levels (MCLs) established for the site. The review also considered the location and usefulness of related monitoring wells with respect to future plume modeling. In a letter dated September 2, 2014, the EPA approved the proposed modification to the site groundwater sampling plan.

The EPA-approved Interim Monitoring Sampling Plan calls for monthly gauging of ten monitoring wells (GP-27R, GP-30A, GP-35A, MP-7, MW-7, MW-16, MW-18, MW-22R, MW-24A, and RW-4), semi-annual gauging of all monitoring wells, semi-annual sampling of 41 monitoring wells, annual sampling of 27 monitoring wells, and semi-annual sampling of the four soil vapor wells (VW-1, VW-2, VW-3, and VW-4). Table 1 provides a summary of the newly approved groundwater and soil vapor sampling plan.

##### **4.4.1 Groundwater Monitoring**

Monthly groundwater gauging of the ten specified monitoring wells was conducted on July 23, August 13, September 10, October 7, November 6, and December 22, 2014. The fall semi-annual groundwater gauging was conducted on August 21 & 22, 2014.

The groundwater gauging/elevation data for the past year are provided in Appendix C, Table C-1. A detailed explanation of the table is provided on the first page of Appendix C. Groundwater contour maps provided as Figures 2 and 3 were created using gauging data collected during the spring semi-annual groundwater gauging event.

The fall semi-annual sampling event for the Maryland and D.C. wells was conducted during the period of September 8 through September 10, 2014. The analytical results for groundwater sampling events for the past year are provided in Appendix C, Table C-2. A detailed explanation of the table is provided on the first page of Appendix C. Groundwater iso-concentration maps were created using analytical results from the September sampling event (Figures 4 through 7).

Figures 8 through 25 present the benzene and MTBE trend analyses for select wells.

A Mann-Kendall statistical analysis of groundwater monitoring wells data trends is presented in Appendix H.

#### *4.4.1.1 In-situ Groundwater Remediation Wells*

To evaluate system performance, groundwater samples, for analysis of volatile organic compounds and TPH-GRO, are collected from MW-61A, MW-61B, MW-62A and MW-62B, and the influent (shallow piezometer) and effluent (deep piezometer) of the ISGR wells during the on-going semi-annual long-term monitoring program. Analytical results for groundwater samples collected from the Area B system performance wells during the September 2014 semi-annual sampling event are provided in Appendix C, Table C-2.

The influent (ISGR-1 Shallow and ISGR-2 Shallow) and effluent (ISGR-1 Deep and ISGR-2 Deep) of the ISGR wells were added to Table 1 for inclusion in the long-term monitoring program.

#### *4.4.1.2 Oxygen Reactive Zone*

To evaluate system performance, groundwater samples, for analysis of volatile organic compounds and TPH-GRO, are collected from wells MW-58, MW-59, MW-60, MW-26A, and MW-26B during the ongoing semi-annual long-term monitoring program. Analytical results for groundwater samples collected from the Area C system

performance wells during the September 2014 semi-annual sampling event are provided in Appendix C, Table C-2.

#### 4.4.2 Passive Sampling Using the HydraSleeve™

The use of HydraSleeve passive samplers was approved by DDOE and EPA for use during the September 2014 semi-annual groundwater sampling event. Groundwater samples were collected from 10 wells (MW-61A, GP-30A, GP-35A, MW-21, MW-45, MW-49, ISGR-1 Shallow, ISGR-1 Deep, ISGR-2 Shallow, and ISGR-2 Deep) using the HydraSleeve passive samplers.

#### 4.4.3 Soil Vapor Monitoring

Semi-annual soil vapor sampling of 2 (VW-1 and VW-2) of the 4 soil vapor wells as well as an ambient sample for VW-1 was conducted on October 23, 2014. Wet weather conditions prevented sample collection (i.e., infiltration of precipitation fills soil pore spaces and inhibits soil vapor flow) from two of the soil vapor wells (VW-3 and VW-4). Analytical results for soil vapor samples collected during the October 2014 semi-annual soil vapor sampling event are provided in Appendix D, Table D-1.

## **5. Submittal of Deliverables**

Chevron submitted the following deliverables to EPA during the reporting period:

- Semi-Annual Progress Report for January 2014 through June 2014 in July 2014.

## **6. Summary of Findings**

This section provides a summary of findings and results for the OMM activities performed during the reporting period.

### **6.1 Area A Dual Phase Extraction System**

The groundwater extraction portion of the DPE system pumped approximately 1,545,536 gallons of groundwater and recovered 12.39 equivalent gallons of dissolved hydrocarbons during the reporting period. The average system flow rate over the entire period was 5.66 gpm. The total volume of groundwater pumped from this site since remediation began in 1989 is approximately 65,678,676 gallons.

The analytical results for groundwater samples collected from sample point SP-3 (treated groundwater that is discharged to the storm drain) (Table A-3 in Appendix A) indicated concentrations of benzene and BTEX in the treated groundwater were below the permit limits (5 µg/L benzene, 100 µg/L BTEX, and 15 mg/L for TPH-GRO) during the reporting period.

The laboratory analytical results for monthly air stripper samples collected at sample points SP-50 (air stripper vapor phase GAC influent) (Appendix A, Table A-4) and SP-52 (air stripper vapor phase GAC effluent, to atmosphere) (Appendix A, Table A-5) indicated concentrations of benzene and TRPH in the treated vapor were below the permit limits. The permit limits are 0.02 pounds per hour of benzene and 20 pounds per day of volatile organic compounds measured as TRPH.

The soil vapor extraction portion of the DPE system recovered 73.8 equivalent gallons of hydrocarbons in the vapor phase during the reporting period. The average air flow rate was 144.91 standard cubic feet per minute when the system was on (excluding down time).

The laboratory analytical results for monthly SVE system samples collected at sample points SP-100 (soil vapor influent) (Appendix B, Table B-2) and SP-200 (soil vapor effluent, to atmosphere) (Appendix B, Table B-3) indicated concentrations of benzene and TRPH in the treated soil vapor were below the permit limits. The permit limits are 0.02 pounds per hour of benzene and 20 pounds per day of volatile organic compounds measured as TRPH.

**Hydrocarbon Recovery Summary for Period and Cumulative Total for System**

| <b>Period</b>               | <b>Liquid-Phase Hydrocarbons (gallons)</b> | <b>Dissolved-Phase Hydrocarbons (eq. gallons)</b> | <b>Vapor-Phase Hydrocarbons (eq. gallons)</b> | <b>Cumulative Total Hydrocarbons (eq. gallons)</b> |
|-----------------------------|--------------------------------------------|---------------------------------------------------|-----------------------------------------------|----------------------------------------------------|
| 7/1/14 through 12/31/14     | 0.00                                       | 12.39                                             | 73.8                                          | 86.19                                              |
| Cumulative Total for System | 856.5                                      | 966.2                                             | 6,476.0                                       | 8,298.69                                           |

The volume of groundwater treated and the corresponding volume of hydrocarbons collected for the entire time the system has been operating on a quarter by quarter basis continued to be tracked (Figure 1).

**6.2 Area B In-situ Groundwater Remediation Wells**

ISGR-1 has continued to consistently operate throughout the reporting period. Utilization of the larger on hand 0.17 inch discharge orifice and adjustments to the submersible pump output, as needed based on observed system performance and seasonal groundwater level influences, has resulted in a significant increase in system uptime for ISGR-2. Increasing the submersible pump output with the larger on hand orifice has increased the pressure in the carbon vessel (equalizing the volume of water supplied by the submersible pump to the carbon vessel and the treated water allowed to gravity drain to the deeper aquifer) preventing the short circuiting/vacuum effect previously observed.

In May 2014 a phone line connection was installed at Area B to improve system uptime/downtime monitoring. Programming of the existing PLC for each ISGR well to send notification of system shutdown was completed in June 2014. System uptime and downtime for each Area B ISGR well is provided in Section 4.1.2 above. ISGR-2 downtime during the reporting period was solely associated with surface water infiltration into the ISGR-2 vault resulting in a high level manhole alarm. This was observed to be most prevalent during the rainy seasons of the past year, end of summer into fall.

Due to the successful operation of ISGR-1 and ISGR-2, by use of the larger on hand 0.17 inch discharge orifice discussed above to increase system uptime, the option for the procurement of a range of discharge orifices sizes has been deferred. If continued uptime evaluation reveals that the procurement of a range of discharge orifice sizes is

warranted, a supplier will be contacted to fabricate a range of orifices sizes out of PVC or acrylonitrile butadiene styrene blanks.

The long term effects of the Area B ISGR wells on reducing the concentration of petroleum hydrocarbons in groundwater will require continued system operation and sample analysis evaluation over a longer period of time. System optimization will be performed as required based on observed system performance.

### **6.3 Area C Oxygen Reactive Zone**

The long term effects of the Area C ORZ system on reducing the concentration of petroleum hydrocarbons in groundwater will require continued system operation and sample analysis evaluation over a longer period of time. System optimization will be performed as required based on observed system performance. DO measurements will continue to be collected on a quarterly basis to verify DO delivery to the subsurface. Emitter cleaning and well maintenance will be performed as required.

## **7. Permit Compliance**

Permits required for activities during this reporting period are described below.

### **7.1 Permits for Operation of the Area A System**

MDE Air Quality General Permit for Groundwater Air Stripping effluent, permit number 033-9-1160 and MDE Air Quality General Permit for Soil Vapor Extraction Equipment effluent, permit number 033-9-1164 were required. Neither of these permits has an expiration date. Sampling and monitoring requirements include periodic effluent monitoring as previously described.

MDE General Discharge Permit, permit number 2008-OGR-8514 (NPDES Permit No. MDG918514) was issued for discharge of treated groundwater at the site. This permit became effective on November 1, 2013, and expires on December 11, 2017. The permit requires weekly effluent sampling, system monitoring, and submission of a quarterly Discharge Monitoring Report.

### **7.2 Permits for Groundwater Monitoring and Operation of Area B and C Systems**

Permit number PA10148538 for Public Space Occupancy was issued by the District Department of Transportation on July 18, 2014 to cover traffic control requirements for sampling, gauging, and OMM of Areas B and C until January 13, 2015. A new permit is applied for and issued on a semi-annual basis.

**8. Summary of Deviations from Approved Plans, Problems Encountered, and  
Corrective Actions Taken**

Due to laboratory analyzer contamination issues, the air samples collected from SP-50, SP-52, SP-100, and SP-200 for the month of August 2014 were not analyzed or reported.

## **9. Summary of Meetings with Public and Government**

No meetings with public or government during the reporting period to report.

**10. Changes in Key Personnel during the Reporting Period**

No changes in key personnel during the reporting period to report.

## **11. Projected Work for the Next Reporting Period**

The following list identifies projected work anticipated to be performed during the next reporting period, January through June 2015:

- Routine operations and maintenance activities for the Area A, B, and C remediation systems;
- Monthly sampling of the Area A DPE system including influent and effluent sampling;
- Bi-weekly sampling of the Area A DPE system effluent to comply with water discharge permits;
- Monthly gauging of select wells near the service station to check for the presence of LPH and to document drawdown caused by the total fluids extraction system;
- Area A system optimization;
- Pull, inspect, and clean (as needed) pneumatic pumps in Area A;
- Clean oil water separator (as needed);
- Continue optimization of the Area B ISGR wells to maintain uptime;
- Area B monthly GAC performance sampling;
- Area B liquid phase GAC replacement (as warranted) planning;
- Area C oxygen cylinder change out;
- Area C oxygen emitter pulling and cleaning (as needed);
- Area C quarterly DO measurement collection;
- Semi-annual groundwater sampling and gauging event in the spring of 2015; and
- System maintenance on Area A, B, and C system as required.

Footnotes:

- (1) This table is adapted from the Interim Measures Sampling Plan, dated April 2006.
- (2) All wells will be gauged in the spring and the fall during the Semi-annual sampling events.
- (3) Sampling will be conducted in the spring and fall (low and high groundwater conditions).

Dual-Phase Extraction System –  
Total Fluids Extraction Data

## APPENDIX A

### DUAL-PHASE EXTRACTION SYSTEM – TOTAL FLUIDS EXTRACTION DATA

#### DESCRIPTION OF DATA TABLES

Chevron uses a central database to store remediation system data and laboratory analytical data. The tabulated data in Tables A-1, A-2, A-3, A-4, and A-5 is an exported summary of the total fluids extraction system data from the database. These data were recorded by the field technician during site visits. The analytical data for influent samples collected for laboratory analysis (Table A-2) are used to calculate the mass (and to estimate the volume) of hydrocarbons recovered in the dissolved phase. Effluent sample data are included in Table A-3 for comparison with permit limits.

The data table includes recent system data. Historical data collected are available in previous progress reports.

The following table lists the column headings in the table with a brief description of each. Please refer to the piping and instrumentation Diagram (Appendix H) for a schematic of equipment and sample ports.

| Column Heading                                       | Description                                                                                                                                                                                    |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Date / Time                                          | Date and time data were recorded.                                                                                                                                                              |
| System Status                                        | System ON or OFF when technician recorded the data.                                                                                                                                            |
| Influent BTEX (µg/L)                                 | Sum of benzene, toluene, ethylbenzene, and total xylenes from influent sample port SP-1.                                                                                                       |
| Effluent BTEX (µg/L)                                 | Sum of benzene, toluene, ethylbenzene, and total xylenes from effluent sample port SP-3.                                                                                                       |
| Treatment Efficiency (%)                             | Equation: (Influent-Effluent) / (Influent).                                                                                                                                                    |
| Totalizer Reading (gallons)                          | Reading on the totalizing flow meter.                                                                                                                                                          |
| Pumped Period (gallons)                              | Equation: (current totalizer reading) – (previous totalizer reading).                                                                                                                          |
| Pumped Total (gallons)                               | Cumulative total gallons of groundwater recovered.                                                                                                                                             |
| Period Average (GPM)                                 | Equation: (Gallons Pumped During Period) / (current Date-Time – previous Date-Time)                                                                                                            |
| Hydrocarbons Recovered Period (gallons) <sup>1</sup> | Equation: [Avg. Influent BTEX (ug/L)] * e <sup>6</sup> * (1/0.2) * (3.785 L/gal) * (1 lb/453.6 g) * (gallons pumped) * (1 gal/6.26 lbs).<br>NOTE: Formula assumes BTEX equals 20% of gasoline. |
| Hydrocarbons Recovered Cumulative (gallons)          | Equation: (Hydrocarbons Recovered During Period) + (Previous Cumulative)                                                                                                                       |
| Operating Extraction Points                          | Wells in operation during the reporting period.                                                                                                                                                |

#### Notes:

(1) Assumptions: BTEX is 20% of hydrocarbon product by volume; density of hydrocarbon product is 6.26 pounds/gallon. The Average (Avg.) Influent BTEX concentration is defined as the mean of the influent concentration for the current and previous sampling events.

TABLE A-1: TOTAL FLUIDS EXTRACTION SYSTEM DATA  
SEMI-ANNUAL PROGRESS REPORT: JULY THROUGH DECEMBER 2014  
FORMER CHEVRON FACILITY 122208, 5801 RIGGS ROAD, CHILLUM, MD

**Notes:**

- (1) Hydrocarbons Recovered Period (gallons) = (avg. inf. conc.) x (e-6) x (1/0.2) x (3.785 L/gal) x (1 lb/453.6 g) x (gallons pumped) x (1 gal/6.26 lbs).  
(2) Formula assumes BTEX equals 20% of gasoline.

**Notes:**

1. Pursuant to permit compliance verification, flow values were assumed to be maximum possible (280 CFM) for 7/2/2012 data and thereafter. Efforts are currently being made to calculate actual flow data. Reported values will be updated following calculation of actual flow.

**Notes:**

1. Pursuant to permit compliance verification, flow values were assumed to be maximum possible (280 CFM) for 7/2/2012 data and thereafter. Efforts are currently being made to calculate actual flow data. Reported values will be updated following calculation of actual flow.

## **Appendix B**

Dual-Phase Extraction System –  
Soil Vapor Extraction Data

## APPENDIX B

### DUAL-PHASE EXTRACTION SYSTEM – SOIL VAPOR EXTRACTION DATA

#### DESCRIPTION OF DATA TABLES

---

##### Overview

Chevron uses a central database to store remediation system data and laboratory analytical data. The tabulated data in Tables B-1, B-2 and B-3 is an exported summary of soil vapor extraction system data from the database. These data were recorded by the field technician during site visits. Analytical data for influent samples collected for laboratory analysis are included in Table B-2 to calculate the mass recovery rates of total petroleum hydrocarbons and benzene. Effluent sample data are included in Table B-3 for comparison with permit limits.

The data table includes recent system data. Historical data collected are available in previous progress reports.

The following table lists the column headings in the table with a brief description of each. Please refer to the piping and instrumentation Diagram (Appendix H) for a schematic of equipment and sample ports.

| Column Heading                                | Description                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Date / Time                                   | Date and time data were recorded.                                                                                                                                                                                                                                                                                                          |
| System Status                                 | System ON or OFF when technician recorded the data.                                                                                                                                                                                                                                                                                        |
| Hour Meter (hours)                            | Field measurement of the hour meter.                                                                                                                                                                                                                                                                                                       |
| Manifold Vacuum (in Hg)                       | Field measurement of vacuum in manifold.                                                                                                                                                                                                                                                                                                   |
| Influent (ppmv)                               | Field measurement of vapor concentration prior to treatment using a photoionization detector.                                                                                                                                                                                                                                              |
| Influent (cfm)                                | Field measurement of total vapor flow in manifold.                                                                                                                                                                                                                                                                                         |
| Effluent (ppmv)                               | Field measurement of vapor concentration after treatment using a photoionization detector.                                                                                                                                                                                                                                                 |

| Operating Extraction Points                   | Wells in operation during the reporting period.                                                                                                                                                                                                                                                                                            |

##### Notes:

- (1) Assumptions: Hydrocarbon molecular weight is 92 grams/mole; vapor behaves like an ideal gas; Average (Avg.) Influent (ppmv) and flow rate (Manifold Extraction in the table) are averages between the current and last events. Unit conversion factors (CV) equations are:

$$\text{CV1} = (92 \text{ grams/mole}) * (1 \text{ mol}/24.45 \text{ L}) * (28.32 \text{ L}/\text{ft}^3) * (1440 \text{ min}/\text{day}) * (1 \text{ lb}/454 \text{ grams}) = 338 \text{ min} * \text{lbs}/\text{day}.$$

$$\text{CV2} = (92 \text{ grams/mole}) * (1 \text{ mol}/24.45 \text{ L}) * (28.32 \text{ L}/\text{ft}^3) * (\text{Runtime in minutes}) * (1 \text{ lb}/454 \text{ grams}) = 0.235 \text{ min} * \text{lbs}.$$

**Notes:**

(1) Hydrocarbons recovered are expressed as toluene (MW = 92 g/mol @ 77F).

(2) Hydrocarbons Recovered (lbs/day) = (inf. conc.) x (92 g/mol) x (mol/24.45 L) x (e-6) x (inf. flow) x (28.32 L/ft3) x (1440 min/day) x (1 lb/453.6 g).

(3) Hydrocarbons Recovered Period (gallons) = (avg. inf. conc.) x (92 g/mol) x (mol/24.45 L) x (e-6) x (avg. inf. flow) x (28.32 L/ft3) x (runtime in minutes) x (1 lb/453.6 g) x (gal/6.39 lb).

**Notes:**

- (1) Benzene (lbs/h) = (benzene conc.) x (e-6) x (1 lb/453.6 g) x (flow) x (28.32 L/ft<sup>3</sup>) x (60 min/hr).
- (2) TPH (lbs/day) = (TPH conc.) x (e-6) x (1 lb/453.6 g) x (flow) x (28.32 L/ft<sup>3</sup>) x (1440 min/day).
- (3) ug/L = (ppmv) x (MW g/mol) x (mol/24.45 L), where MW benzene = 78 and MW TPH = 92.
- (4) One Tedlar bag containing the effluent air sample collected on 5/6/13 ruptured during shipment to the laboratory. As a result, no sample was available for analysis of benzene, toluene, ethylbenzene, and xylenes.
- (5) BTEX values after 7/1/2013 were converted from ppb

## **Appendix C**

Groundwater Monitoring Data

## APPENDIX C

### GROUNDWATER MONITORING DATA

#### DESCRIPTION OF DATA TABLE

---

##### Overview

Chevron uses a central database to store groundwater monitoring data including laboratory analytical data. The tabulated data in Appendix C (Tables C-1 and C-2) are exported summaries of groundwater elevation data and analytical data for the past two years. Groundwater elevation data were measured using an interface probe in wells near the service station and a water level indicator at all other locations.

The following table lists the column headings in the table with a brief description of each.

| Column Heading               | Description                                                                                      |
|------------------------------|--------------------------------------------------------------------------------------------------|
| Date of Measurement          | Date data were recorded.                                                                         |
| Depth to Water (feet)        | Depth to groundwater (ft)                                                                        |
| TOC Elevation (feet)         | Top of casing elevation (ft)                                                                     |
| Water Table Elevation (feet) | Corrected water table elevation equation:<br>(TOC) – (Depth to Water) + [(0.75)*(LPH Thickness)] |
| Depth to LPH (feet)          | Depth to LPH (feet)                                                                              |
| LPH Thickness (feet)         | Equation: (Depth to Water-Depth to LPH)                                                          |
| LPH Elevation (feet)         | Equation: (TOC-Depth to LPH)                                                                     |
| Benzene (µg/L)               | Laboratory reported concentration                                                                |
| Toluene (µg/L)               | Laboratory reported concentration                                                                |
| Ethylbenzene (µg/L)          | Laboratory reported concentration                                                                |
| m,p-Xylene (µg/L)            | Laboratory reported concentration                                                                |
| o-Xylene (µg/L)              | Laboratory reported concentration                                                                |
| Methyl-t-butyl ether (µg/L)  | Laboratory reported concentration                                                                |
| TPH-GRO (µg/L)               | Laboratory reported concentration                                                                |

Table C-1: GROUNDWATER MONITORING DATA  
SEMI-ANNUAL PROGRESS REPORT: JULY THROUGH DECEMBER 2014  
FORMER CHEVRON FACILITY 122208, 5801 RIGGS ROAD, CHILLUM, MARYLAND

| Well No.      | Date of Measurement | Depth to Water (feet below casing) | PVC Casing Elevation (feet MSL) | Water Table Elevation (feet MSL) | NAPL Measurement (feet) | NAPL Thickness (feet) | NAPL Elevation (feet MSL) | Comments |

Notes:

- 1) J - Estimated value
- 2) ND - Not detected at the minimum reported quantification limit
- 3) Wells VW-03 and VW-04 were not sampled during the reporting period due to the presence of water.
- 4) E - Exceeds instrument calibration range

#### Notes

1. Non-detect concentration values were represented as half of the respective Minimum Detection Level as identified in the laboratory analytical reports (5 µg/l) for the Total Xylenes concentration calculation

- SHEET NOTES**
- SEE SHEET NO. 4 FOR MODIFICATION WORK.
  - REMOVE CONNECTIONS FROM WELL PTW-A.
  - METERING PUMP TO BE LOCATED IN THE CARBON SHED ON/ABOVE THE CHEMICAL DRUM
  - ANGLE WELL RUN/STOP WIRED TO SOLENOID RELAY

**CRITICAL SAFETY DEVICE:**

- ES-1 EMERGENCY STOP BUTTON IS TIED DIRECTLY TO PANEL B AND PANEL A. WHEN ACTIVATED, EMERGENCY STOP BUTTON SHUTS DOWN ALL EQUIPMENT, BUT DOES NOT KILL POWER TO THE SYSTEM. SYSTEM OPERATORS WILL BE NOTIFIED. (CS-1)
- FLAME ARRESTER PREVENTS UPSTREAM PROPAGATION OF FLAME FROM CATALYTIC OXIDIZER (CS-2).

**NOTE:**

BEGINNING OCTOBER 2013, THIS DRAWING HAS BEEN MODIFIED BY ARCADIS U.S. TO SHOW AS-BUILT CONDITIONS.

Mann-Kendall Statistical Analysis

**Mann-Kendall Statistical Analysis  
Former Chevron Facility 122208  
5801 Riggs Road, Chillum, Maryland  
December 2014**

The Mann-Kendall statistical analysis was used to determine trends in dissolved-phase hydrocarbon concentrations at the Chillum site. These data will be used to support the site-wide groundwater remedial strategy of monitored natural attenuation (MNA).

## **SITE-WIDE GROUNDWATER REMEDIAL OBJECTIVE**

The approved Corrective Measures Study (CMS) (Gannett Fleming, 2007) presented a site-wide groundwater remediation strategy that included MNA. One method to demonstrate that MNA is effective at decreasing hydrocarbon concentrations is the statistical evaluation of trends in the sampling results. The Mann-Kendall trend test was selected as an industry-accepted method to provide evidence as to whether dissolved-phase hydrocarbon concentrations are stable or decreasing over time.

## **MANN-KENDALL TREND TEST**

The Mann-Kendall trend test is a non-parametric test for linear trends based upon the concept that a series of data points without a trend should fluctuate randomly around a constant mean. If an increasing trend were to exist, one would expect an earlier point to have a lower value than a later point. The converse would be true if a decreasing trend were present. A Mann-Kendall statistic  $S$  is computed by comparing each pair of data points in a data set and assigning a value of +1 or -1 if the earlier data point is less than the later data point or greater than the later one, respectively. If the two data points are equal, the pair is assigned a zero. The values assigned to the pairs are summed. If the total is positive, it implies that the majority of the differences between the points are positive, indicating a positive trend. Likewise, a negative sum indicates a decreasing trend. A value at or near zero indicates that the differences are roughly equal, implying that there is no trend. A critical value of  $S$  is determined based on the number of points in the data set and the level of significance ( $\alpha$ ) of the test. If the Mann-Kendall statistic  $S$  exceeds the critical  $S$ , then an upward trend is statistically significant. Conversely, if the Mann-Kendall  $S$  is negative and its absolute value is greater than the critical  $S$ , then there is a statistically significant downward trend. If the absolute value of  $S$  is less than the critical value of  $S$ , then the data is considered to have no trend.

The Mann-Kendall Test is robust because missing values are allowed and the data set need not conform to any particular distribution. Also, laboratory data reported as below the laboratory detection limit can be used and are reported as half the laboratory detection limit (USEPA, 1998). This approach can be used because the Mann-Kendall methodology uses only the relative magnitudes of the laboratory data rather than actual measured values (Gilbert, 1987). This test is described in detail in the unified guidance provided by the United States Environmental Protection Agency for the analysis of groundwater statistics (USEPA, 2009, p. 17:30-34).

## METHODS

A Geoprobe<sup>®</sup> was used to obtain an exhaustive profile of groundwater at the site during 2001 and 2002. The Geoprobe groundwater data were used to map the centerline of dissolved-phase hydrocarbon concentrations in groundwater and subsequently install monitoring wells along the centerline of dissolved-phase hydrocarbons (Gannett Fleming, 2006).

The presence of a mappable clay body in the subsurface (as evidenced from the Geoprobe soil investigation) splits the dissolved-phase hydrocarbons in groundwater into two separate centerlines. As a result, these two centerlines are identified as the west centerline and the east centerline (Figure 1). Wells used to define the centerlines are as follows:

| <b>West Centerline</b> | <b>East Centerline</b> |
|------------------------|------------------------|
| MW-22R                 | MW-22R                 |
| MW-24B                 | GP-39A/GP-39R          |
| MW-26B                 | MW-47                  |
| MW-33B                 | GP-2E(45-50)           |
| MW-58                  | MW-25B                 |
| MW-59                  | MW-27B                 |
| MW-60                  | MW-53                  |
| MW-62A                 |                        |
| MW-62B                 |                        |

The Mann-Kendall test was performed for benzene and methyl tert butyl ether (MTBE) for each well within the centerlines. Mann-Kendall trend analysis tables for each well along the west and east centerlines are presented in Attachments A and B, respectively. The 10 most recent groundwater sampling results were used in the analysis. Values that were reported as below the laboratory detection limit were assigned a value of half of the detection limit.

## RESULTS OF MANN-KENDALL ANALYSES

Tables 1 and 2 provide groundwater sampling results for individual wells along the west and east centerlines. Table 3 provides a general summary of the Mann-Kendall tests performed for both benzene and MTBE. The tests were run in a two-tailed mode at two levels of confidence, 90% (with  $\alpha = 0.05$  per tail) and 95% (with  $\alpha = 0.025$  per tail). Several trends were noted that are provided below.

Results of the analysis for the west centerline were as follows:

- No statistically significant trends were identified for benzene or MTBE concentrations in MW-22R, MW-24B, MW-26B, MW-59, MW-60, MW-62A, or MW-62B;
- A statistically significant decreasing trend was identified for benzene concentrations in MW-33B, but only at 90% confidence; statistically significant trends were identified for MTBE concentrations in MW-58 (only at 90% confidence) and MW-33B.

Results of the analysis for the east centerline were as follows:

- No statistically significant trends were identified for benzene or MTBE concentrations in MW-22R, MW-47, or MW-25B;
- Decreasing trends in benzene concentrations in GP-39A/GP-39R and MW-53 and MTBE in GP-39A/GP-39R, GP-2E (45-50), MW-27B, and MW-53 were found to be statistically significant.

## **SUMMARY AND CONCLUSIONS**

Dissolved-phase hydrocarbon concentrations for centerline wells were either decreasing or did not indicate a statistically significant trend. Based on this line of evidence, MNA is working to decrease dissolved-phase hydrocarbon concentrations at the site.

## **RECOMMENDATIONS**

The following corrective measures were implemented at the site:

- Area A - an expanded DPE system, which included the addition of four vertical recovery wells and one angle recovery well;
- Area B - Two In-Situ Groundwater Remediation (ISGR) Wells installed in the residential neighborhood (Oglethorpe Alley); and
- Area C - an Oxygen Reactive Zone installed in the residential neighborhood (Nicholson Alley), which includes a series of in-situ oxygen emitting probes.

As part of the corrective measures for Area A, wells MW-22R and GP-39R were over drilled and added to the expanded DPE system in Area A. MW-24B will be near or within the radius of influence of the ISGR Well system in Area B. MW-26B will be adjacent to and down gradient of the Oxygen Reactive Zone in Area C.

The Mann-Kendall statistical analysis will continue to be performed on an annual basis using the semi-annual groundwater monitoring data for wells along the west and east centerlines to confirm that hydrocarbon concentrations are continuing to decrease or remain stable. It is recommended that the statistical analysis methodology be reviewed in terms of parameters such as groundwater flow velocity, stratigraphy, and site history. The next Mann-Kendall update will be submitted in January 2016.
